Smart Contract Audit Report

AirDrop & T2T2Coin

Nov. 4th, 2023

Copyright

1. Overview

SharkTeam recently received the requirements for AirDrop&T2T2Coin smart contracts audit. In this audit, the SharkTeam security experts communicate with T2T2 team to conduct smart contract security audit under controllable operation, so as to avoid any risk in the audit process as far as possible.

Project Overview :

Project Name	AirDrop&T2T2Coin
Description	SocialFi
Language	Solidity
Codebase	Private Pro
AirDrop MD5	c7e2f2d6ce5472a7729754b77c102f35
T2T2Coin MD5	27465ab6a704ad67756375afe0eb4f30

Audit methods :

Firstly, through static analysis, dynamic analysis and other analysis technologies, the smart contracts in the project were automatically scanned and manually reviewed; after that, the SharkTeam security experts conducted a detailed manual audit of the smart contracts line-by-line. From the four dimensions of high-level language, virtual machine, blockchain, and business logic, nearly 200 audit items of smart contracts have been comprehensively audited.

Core Audit Types:

For the Solidity smart contract, SharkTeam's audit items cover four layers: language,

virtual machine, blockchain, and business, and four levels of high risk, medium risk, low risk, and information. Some of the common high-risk items (not all vulnerabilities) are as follows:

- Function Visibility and Access Control
- Reentrancy Vulnerability
- Contract and Storage Initialization
- Token Minting and Burning
- Centralization of Power
- Function Logic Vulnerability
- Flashloan and Price Manipulation
- DAO Proposal Attack
- Contract Upgrade Issues
- Randomness and Revert Attack
- Insufficient Randomness
- Integer Overflow/Underflow
- Divide/Multiply and Integer Precision
- Unchecked/Unused Return Values
- Blockchain Timestamp Dependency
- Transaction Order Dependency and Front Running
- Denial of Service (DoS)

Audit Scope :

Contract Files	MD5
access/Ownable.sol	399f02455c49f0a2bb3e1d0f322f118b
utils/Utilities.sol	a7b72566432376fad2d20c0c522e83a9
AirdropErc20.sol	2c9f5b0963a055f4565763f400b888ab
T2T2Coin.sol	3c97fb00e71c52951a0d48b3487db2bb

Audit results :

AirDrop&T2T2Coin smart contracts audit results: **Pass**.

2. Findings

2.1 Summary

Vulnerability list :

ID	Item	Severity	Category	Status
1	Cannot-Modify-ERC20-Metadata	Info	Language	Fixed
2	Redundant-Check	Info	Language	Fixed
3	Unused-Internal-Functions	Info	Language	Unfixed
4	Centralization-Risk	Info	Business	Unfixed

2.2 Detailed Results

2.2.1 Unused-Internal-Functions [Info]

Description:

There are unused internal functions in the contract, such as _burn. Although it will not affect the security of the contract, it will consume more Gas while deploying the contract.

Recommendation:

It is recommended to delete all unused internal functions to save transaction costs while deploying the contract. Even if not deleted, these internal functions will not affect the security of the contract.

2.2.2 Centralization-Risk [Info]

Description:

The owner and admin are centralized high-privilege accounts that are closely related to the core business. Only these accounts can update some key state variables. Once the private keys are leaked or stolen, the project will suffer a devastating blow.

Recommendation:

Properly keep the private keys of the high-privilege account secure. And try to avoid the loss, leakage, theft, etc. of any private key as much as possible.

Appendix A: Smart Contract Audit Items

ID	Item	Category	Severity
TVE-001	Different-Pragma-Directives-Are-Used	Language	Info

Appendix B: Vulnerability Severity Classification

The nature of vulnerabilities is unintentional and unexpected security flaws or risks, which can be divided into four threat levels: High, Medium, Low and Info. The classification is mainly based on the impact, likelihood of utilization and other factors.

The impact is defined mainly according to the three dimensions of confidentiality, integrity and availability;

The likelihood of utilization is defined mainly according to three dimensions: attack vector, attack complexity and authentication.

Impact / Likelihood	critical	high	medium	low
low	High	High	Medium	Low
medium	High	Medium	Low	Low
high	Medium	Low	Low	Info
Ex-high	Low	Low	Info	Info

SharkTeam has tried the best to ensure the accuracy and reliability of the content when writing this report, but SharkTeam will not be responsible for the loss and damage caused by the omission, inaccuracy or error in this report. The safety audit analysis and other contents of this report are based on the materials provided by the project team. This audit only focuses on the audit items provided in this report, and other unknown security vulnerabilities are not within the scope of this audit. SharkTeam cannot determine the security status of facts that appear or exist after the report. SharkTeam is not responsible for the background or other circumstances of the project.

The content, services and any resources involved in this report cannot be used as the basis for any form of investment, taxation, law, and supervision, and there is no relevant responsibility.

About SharkTeam

SharkTeam's vision is to secure the Web3 world. The team consists of experienced security professionals and senior researchers from all over the world, proficient in the underlying theory of blockchain and smart contracts, providing services including smart contract auditing, on-chain analysis, emergency response, etc. We have established long-term partnerships with key players in various areas of the blockchain ecosystem, such as Polkadot, Moonbeam, polygon, Sui, OKC, imToken, ChainIDE, etc.

We implement almost 200 auditing contents that cover four aspects: high-level language layer, virtual machine layer, blockchain layer, and business logic layer, ensuring that smart contracts are completely guaranteed and Safe.
